

# Uinxed Development Outline

## Project definition

Uinxed-Kernel is an open-source operating system kernel based on the GNU General Public License (GPL-3.0), designed to provide a lightweight, efficient, and scalable operating system platform. The project aims to offer developers and enthusiasts a kernel framework for learning, experimentation, and development, supporting basic functionalities such as multitasking, device drivers, file systems, and user interaction.

## Project attribution

The Uinxed-Kernel project is an independent open-source initiative launched by the ViudiraTech community. Despite this, the project itself does not belong to any private organization or individual, including ViudiraTech itself. The ViudiraTech community holds the right to interpret the project, but this does not imply ownership of the project.

## Project Objectives

The Uinxed-Kernel project's goal is to create an open, free, and simple kernel similar to major UNIX-like kernels, specifically designed for x86 embedded systems and other purposes.
